

Sediment Removal Separator

The Sediment Removal Separator is designed to remove undissolved sediment and entrained air from cooling towers, along with hot and chilled hydronic installations. The Tangential design optimizes sediment removal with its vortex action that forces the sediment to the outside and into the bottom sump for removal. The air is thrown to the middle and released upward to the air release valve giving the dual capabilities of a dirt and air separator.

Specifications

- Carbon Steel Construction
- ASME Design and Stamped
- Max Design Pressure: 125 PSI
- Max Design Temperature: 350°
- Removes Sediment and Entrained Air
- Tangential Design and Full Flow
- Higher Pressures Available thru 300 PSI
- Larger Sizes Available
- Dimensions are Approx, ask for Print

Model	Size	Dia. (A)	H	D	C	E	F	G
