PF Series: Plate & Frame Heat Exchangers

Taco PF Series Plate and Frame Heat Exchangers are ASME designed and constructed. Computerized product selection helps you choose the heat exchanger that's just right for your application. Their compact size and ease of servicing, coupled with Taco dependability, make the PF Series the perfect choice.

TACO PF Series: Plate and Frame Heat Exchanger Specification

Furnish a TACO plate and frame heat exchanger to meet the operating conditions as indicated in the attached schedule.

The exchanger shall be designed, constructed and tested in accordance with Section VIII, Division I of the ASME Pressure Vessel Code, and shall be code stamped. Pressure vessels provided for installation in Canada shall be marked with the appropriate CRN number.

Preference will be given to single pass designs with all system connections to be located on the face of the fixed cover plate.

The plate and frame heat exchanger's fixed and movable covers shall be designed to provide sufficient uniform thickness to withstand all loading. Stiffeners and welded reinforcements shall not be permitted. Any plate within the exchanger's plate pack shall be replaceable without the need to remove other plates.

A roller bearing shall be provided on the movable cover for all units with port sizes 3" or larger. The frame assembly shall be of bolted construction. Welding to the pressure retaining components is not permitted. The frame assembly design shall allow the addition of a minimum of 10% additional plates.

Each plate shall be pressed from a homogenous metal sheet in one step. Each plate channel shall be designed to allow full design pressure on one side with no pressure on the adjacent plate channel. Contact between adjacent plates is required to optimize structural integrity and elimination of vibration.

Gaskets shall be designed to indicate leakage across the sealing gaskets prior to the intermixing of fluids.

The suspension and guidance method in the design of the plates, frame, carrying and guide bars shall mechanically align the plates during tightening. Gasket surfaces shall be used for sealing not for plate alignment. The carrying and guide bar surfaces in contact with the plate pack shall be stainless steel. All other carbon steel surfaces except the bolts shall be epoxy painted.

A stainless steel OSHA shroud shall be provided.

A comprehensive operations and maintenance manual and ASME nameplate shall be attached on the face of the fixed cover.

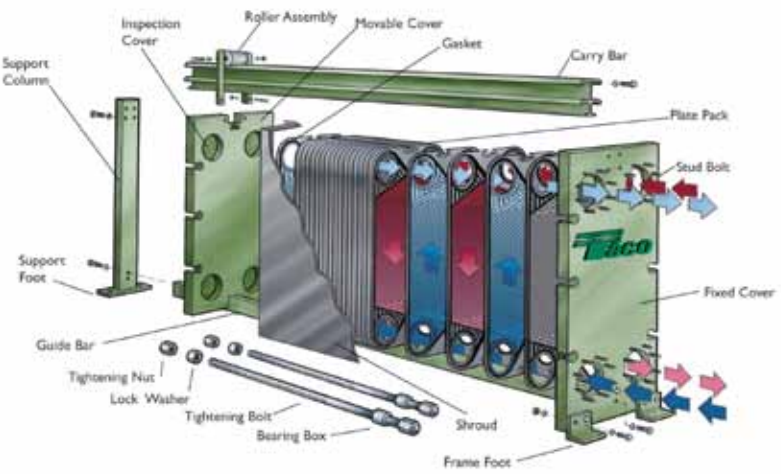
Connections less than or equal to 2-inch shall be NPT type. Connections larger than 2-inch shall be of studded port design. Each studded port shall be lined with a fluid compatible material to prevent process fluid from coming in contact with the painted cover.

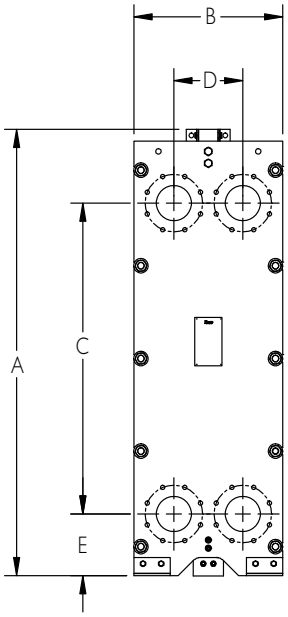
The exchanger shall be hydrostaticly tested in accordance with the requirements of the ASME Code Section VIII Div 1, para. UG-99.

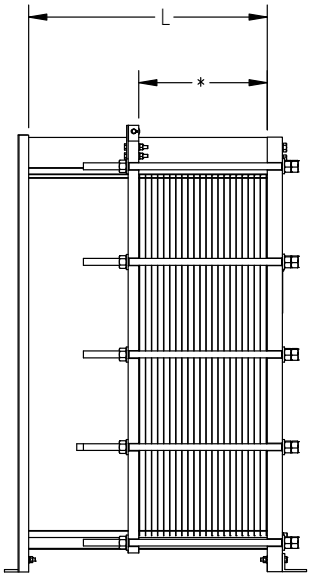
A computer generated submittal and specification sheet indicating the criteria used in each unit's selection shall be submitted for approval.

Applications

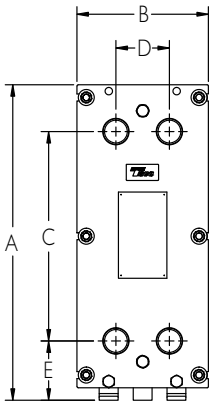
Economizer free cooling; ground source heat pumps; ground water cooling; water source heat pump freeze protection isolation; campus (district) heating and cooling; industrial processes; and pressure zone isolation.

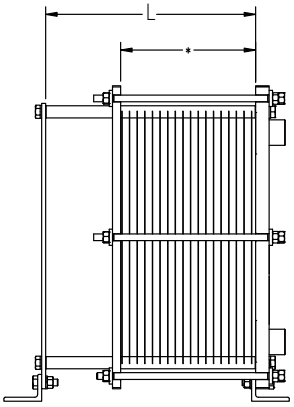






* Plate Pack tightening dimension varies with number of plates. This value is provided within selection program output





Unit Type	A	B	C	D	E	L	Maximum # of Plates	Port Size		Maximum Flow (GPM)	Maximum Surface Area (Sq. Ft.)

These dimensions may be subject to change

Frame Designs & Operating Pressures: 125 PSI & 150 PSI

Materials: 304SS & 316SS

Standard & High Temperature Gaskets: Nitrile & EPDM

Glue-Free Gaskets
Glue-free clip on gaskets offer fast and easy gasket replacement on site.

Glued Gaskets
Glued gaskets offer increased reliability, especially for repeated openings.
